Opting for electric mobility

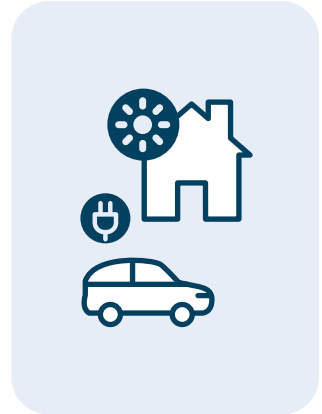

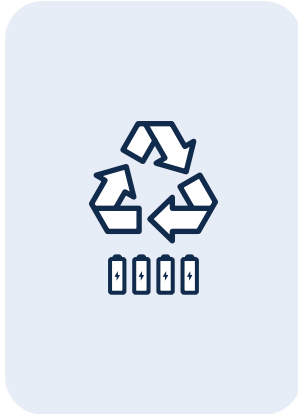

Why make the switch to electric mobility?

CO₂ emissions over the vehicle's lifetime (based on an ADAC study, December 2022).

Charging your car with your own photovoltaic energy.

Recycling of 95% of battery components is already the standard today.

Lower running costs (energy and maintenance). Financial subsidies and tax benefits for the acquisition.

An electric car emits **less CO₂** than a combustion-powered car over its lifecycle, including manufacturing.

Several suppliers are already offering cars with cobalt-free batteries to reduce their social impact.

Compare available charging stations and their eligibility for subsidies.

What about hydrogen?

Electric cars are much more efficient than hydrogen or e-fuel vehicles. With the same amount of energy, a battery-powered car travels twice as far as a hydrogen car and four times as far as a car running on e-fuels.

Energy requirements of vehicles per 100 km

Climate protection is our collective responsibility

Let's take action together

The government is providing financial support to encourage and promote the purchase of bicycles, electric vehicles, and the installation of charging stations, as well as energy-efficient renovation and sustainable construction of housing, heating systems that use renewable energies, and to incentivise investing in photovoltaics.

Together with the municipalities of Luxembourg and the nova naturstrom fund, they support you to ensure the success of your projects.

For more information on the subsidies available for your e-mobility project, visit subsidies.klima-agence.lu to find out how much you are eligible to benefit from!
